COMPANY PROFILE

Doewe Technologies, headquartered in Beijing, has been operating for a decade and currently has branches including the Beijing R&D Center, Chengdu R&D Center, Doewe Shanghai, Doewe Shenzhen, and Doewe Hong Kong. The company is fully committed to building its independent brand "Doewe," with its business covering two main categories: Advanced Sensing Measurement and Control (ASMC) and Professional Test and Measurement Solutions (PTMS).

The ASMC product line provides innovative high-precision sensing acquisition and data analytics solutions. PTMS focuses on industry-specific test and measurement solutions for audio, video, and RF applications. It has established the 5XC product system, serving sectors such as transportation, broadcasting, automotive electronics, consumer electronics, and university research institutes.

Through relentless effort, several of the company's products have become benchmark test instruments in their respective industries. Doewe Technologies also holds multiple core patents and software copyrights, participates in relevant industry standards working groups, and contributes to the formulation of national and industry standards. Building on past achievements, Doewe continues to increase its R&D investment. We have never forgotten our original aspiration, firmly believing that only profound technological accumulation creates value. We persistently pursue innovation in test and measurement technology, dedicated to technology development, application software services, and research in test and measurement solutions.
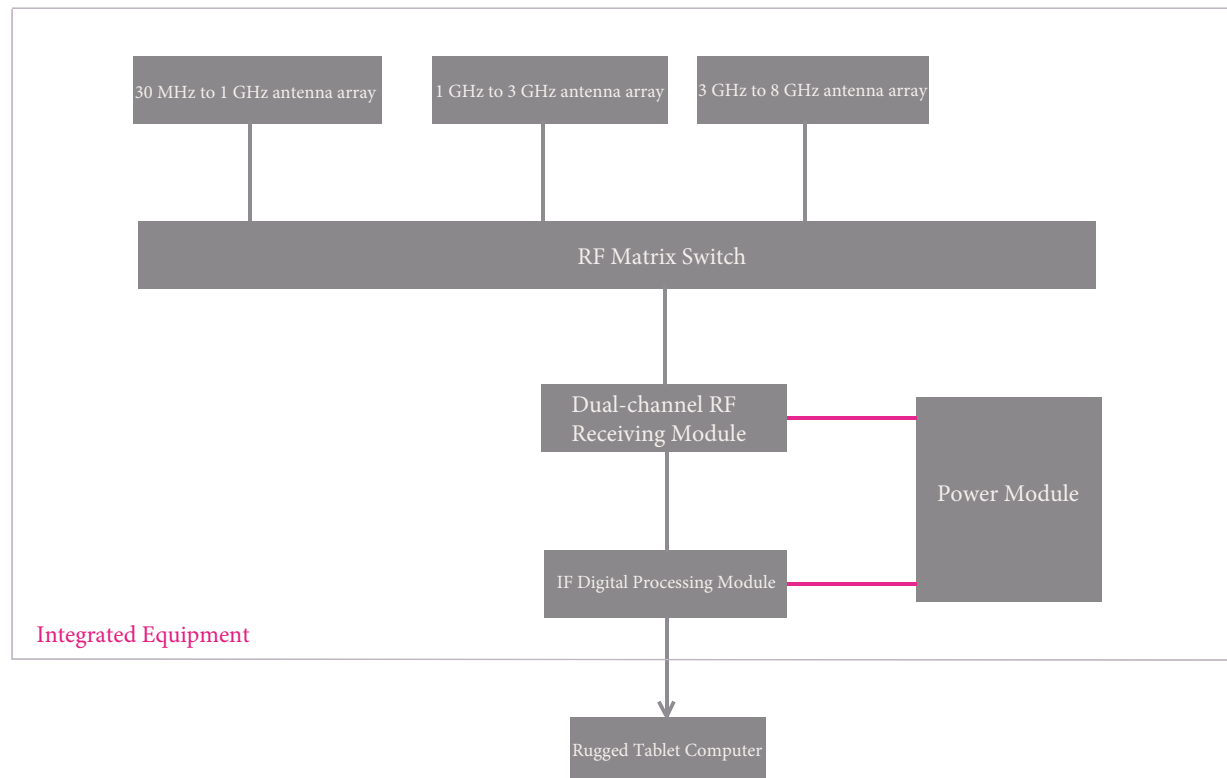

Leveraging its Beijing headquarters, related technical centers, and subsidiaries, Doewe Technologies has gradually established a nationwide pre-sales and after-sales service network, providing customers with professional technical consultation. Guided by the principles of "Rigorous, Efficient, Professional, Innovative," Doewe Technologies will continue steadfastly on this path, living up to the trust of every customer.

The journey ahead is long and challenging. We will accompany you on this path of growth to create a new future of technology together.

overview

The wireless monitoring and positioning system MDFS fully considers the requirements of portability, quick installation, and index performance. For the 30MHz-8GHz frequency band, a seven-element dipole uniform circular array is adopted, while an eight-element horn antenna uniform circular array is used for the 8GHz-18GHz band. Paired with a dual-channel monitoring and direction-finding receiver, it realizes the monitoring and direction-finding functions in the 30MHz-18GHz range.

The equipment composition of the wireless monitoring and positioning system MDFS is shown in the following figure

30 MHz to 1 GHz antenna array	1 GHz to 3 GHz antenna array	3 GHz to 8 GHz antenna array

System Introduction

Main Functions

● **Panoramic Spectrum Monitoring**

The function of continuous scanning according to the set tasks and parameters integrates signal scanning, signal detection, signal type discrimination, occupancy measurement, rain plot, amplitude-time domain distribution, etc. It can acquire power spectrum distribution data, signal or noise level data, and dynamic data of signal level changes, which can be used as needed. All measurement results can be displayed in a way combining data and graphics, and statistical reports of the measurement results can be generated.

Continuous Scanning Screenshots

Discrete scanning can monitor any set of unrelated discrete frequencies, and real-time measure the instantaneous value, maximum value, minimum value and average value of signal level and field strength for each frequency. This function can extract radio signals according to the set threshold, and real-time calculate the channel occupancy of radio signals. The system carries out graphical analysis and display through real-time scanning spectrogram, waterfall diagram, channel occupancy statistical chart and signal list.

Discrete Scan Screenshot

Main Functions

● **Specific Signal Spectrum Monitoring**

It monitors specific frequency bands, frequencies, and signal types to provide a basis for frequency surveillance. It can conduct comprehensive measurement and analysis of frequency, field strength, bandwidth, modulation, intermediate frequency spectrum, IQ, and other measurement parameters recommended by the ITU. The measurement standards comply with ITU-R specifications such as SM.377, SM.378, SM.433, SM.328, SM.1880, and SM.1600.
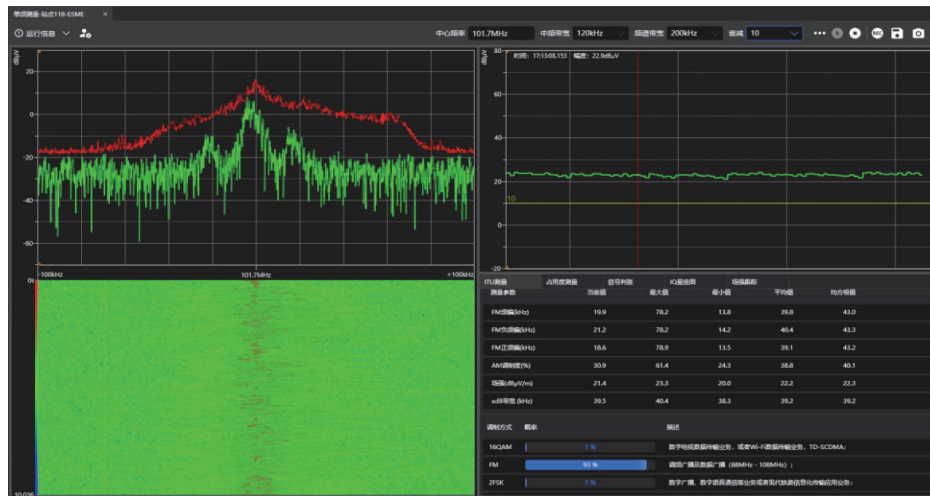

● **Parameter Measurement**

It supports parameter measurement and analysis of conventional fixed-frequency, frequency-hopping, spread-spectrum, and pulse signals within the operating frequency band, and can measure parameters such as signal frequency, level, and bandwidth.

1)Frequency Hopping Signal Monitoring

The frequency-hopping signal monitoring function of the device, based on broadband swept frequency spectrum, enables automatic monitoring of frequency-hopping signals over an extremely wide frequency band. It can quickly detect multiple frequency-hopping signals and preliminarily acquire and provide the frequency set of frequency hopping. The system then automatically locks onto each frequency-hopping signal for parameter measurement based on IQ signals, allowing the acquisition of frequency sets, hopping rates, frequency-hopping patterns, etc., of the frequency-hopping signals.

2)Spread Spectrum Signal Monitoring

The spread-spectrum signal monitoring involves the monitoring and analysis of spread-spectrum signals. The system intercepts the mean value of the mean square correlation function and the maximum eigenvalue of the covariance matrix of the signal, using them as the Fx-axis and Fy-axis respectively to form a two-dimensional feature plane. Through the quantum Memetic algorithm, it optimizes the parameter combination of the decision function under the minimum error criterion to obtain the optimal decision function, which is used to distinguish between noise and signals. These parameters can be estimated by correlation methods or cyclic spectrum methods.
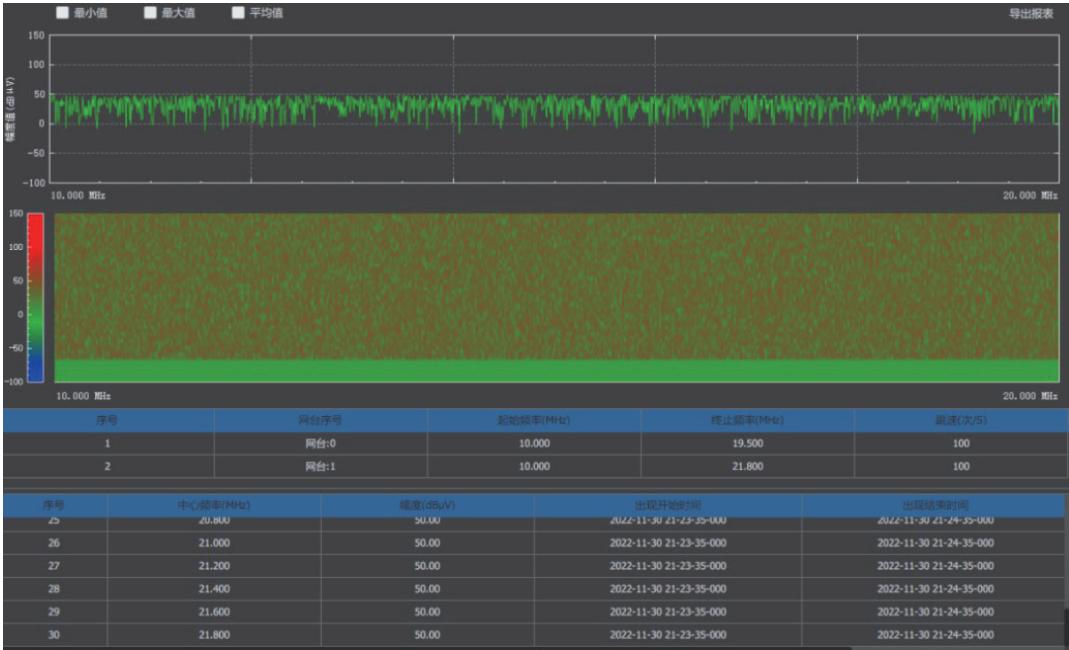

3)Pulse Signal Monitoring

It realizes real-time detection of pulse signals within the bandwidth range of the specified center frequency, measures and analyzes the center frequency, pulse amplitude, repetition period, intra-pulse feature type, and intra-pulse modulation parameters of pulse signals, and real-time displays the intermediate frequency spectrum and time-signal amplitude diagram.

● **Direction Finding and Positioning**

It has functions such as fixed-frequency direction finding, broadband multi-signal direction finding, and scanning direction finding. It can real-time indicate data such as the azimuth and amplitude value of signals, and can perform intersection positioning according to the direction-finding results of a single station or multiple devices.

● **Signal Warning**

Both the scanning and signal analysis functions have manual threshold or automatic noise threshold capabilities, with automatic measurement and alarm functions for excessive signals, and can perform signal discrimination and alarming based on thresholds. Three types of thresholds are supported: manual threshold, automatic noise threshold, and electromagnetic environment template threshold. The electromagnetic environment template threshold scans and monitors one or more frequency bands, real-time measures parameters such as the instantaneous value, maximum value, average value, and minimum value of the signal level at each frequency, extracts signals based on automatic or manual thresholds, and saves the maximum value, minimum value, mean value, signal list, and other information to form a signal template. This signal template characterizes the electromagnetic environment status of these service frequency bands.

System Introduction

| Main Functions
Electromagnetic Environment Template

The generated template is used for comparative scanning. Signals exceeding the template form a new signal list, and alarms are triggered for new or suspected signals.

Main Functions

● **Burst Signal Capture**

The system has the capabilities of fast spectrum scanning and broadband monitoring. When collecting and analyzing an 80MHz real-time bandwidth, it can real-time capture all signals within the bandwidth.

● **Monitoring Data Collection and Storage**

The data acquisition and processing software of the spectrum monitoring and direction-finding equipment can store, record, and replay measurement raw data, analysis statistical data, etc., and can statistically analyze the field strength values, occupancy, and other information of each frequency based on the frequency monitoring results.

System Metrics

- Monitoring and direction-finding frequency range: 30MHz to 8GHz
- Direction-finding sensitivity: ≤20dBuV/m
- Direction-finding error: ≤2° (R.M.S)
- Continuous scanning speed: ≥60 GHz/s (25 KHz step)

- Instantaneous dynamic range: ≥65 dB
- Monitoring sensitivity: better than -110 dBm
- Max. instantaneous intermediate freq. BW: ≥80 MHz
